This peptide comprises amino acid residues 175-183 in the DEF box region (see AAW30501) of transcription factor DP1. Claimed peptides (II) (see AAW30502-07) containing this and/or another motif (see AAW30503) of the DEF box, are antagonists of the heterodimeriaation of a DP protein with an E2F protein. Also claimed are variants of these peptides, especially contraining substitutions of residues corresponding to residues 167, 169, 171 and 175 of DP-1, fusion proteins (III) comprising (I) or (II) and membrane translocation sequence (see AAW30508), expression vectors encoding (I)-(III) and host cells. (I)-(III) are used therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in viro, e.g. for purging bone marrow. Surgical stens comprising (I)-(III) are used to treat or prevent restenosis in patients who have undergone angioplasty. (I)-(III) function by inactivating the DNN-binding activity of DP/E2F heterodimers. They are also used as research reagents, as positive controls in assays for identifying antagonists of DP-I/E2F dimerisation and as immunoassay nucleic acids encoding (I)-(III) to control by laced simunoassay nucleic acids encoding (I)-(III) to control by levels in cells, particularly by gone therapy. When formulated with cytotoxic or cytostatic agents, (I)-(III) enhance cell killing.
 inducing apoptosis, specifically in tumour and cardiovascular cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DP-1; transcription factor; antagonist; E2F protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour; surgical stent; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100.0%; Score 42; DB 19; Length 9; 100.0%; Pred.                                                                                                                          Peptide H5 comprises amino acid residues 168-183 in the DBF box (I) (see AAM30501) of transcription factor DP1. Claimed peptides (II) (see AAM30504-07) containing one or both of 2 morifs (see AAM30502-03) of the DBF box are capable of antagonising the heterodimerisation of a DP protein with an E2F protein. Also claimed are variants of these peptides, especially containing substitutions of residues corresponding to residues 167, 169, 171 and a membrane translocation sequence (see AAM30508), expression vectors cardiovascular cells, either in vivo or in vitro, e.g. for purging therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging treat or prevent restenosis in patients who have undergone angioplasty. (I) (III) function by inactivating the DNA-binding activity of DP/E2F heterodimers. They are also used as research reagents, as positive controls in assays for identifying antagonists of DP-1/E2F dimerisation and as immunosasay agents. Also described is the use of sequences antisense to nucleic acids encoding (I) (III) enhance cell killing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                             Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

(i) (see AAW30501) of transcription factor DP1. Claimed poptides (II) (see AAW30501) of transcription factor DP1. Claimed poptides (II) (see AAW30501-07) containing one or both of 2 motifs (see AAW30502-03) of the DEF box are capable of antagonising the heterodimerisation of a DP protein with an BZP protein. Also claimed are variants of these peptides, especially containing substitutions of residues corresponding to residues 167, 169, 171 and 175 of DP-1, fusion proteins (III) comprising (I) or (III) and membrane translocation sequence (see AAW30508), expression vectors encoding (I)-(III) and host cells, specifically in tumour or therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging bone marrow. Surgical stents comprising (I)-(III) are used to treat or prevent restenosis in patients who have undergone angioplasty. (I)-(III) function by inactivating the DNA-binding activity of DP/BZP heterodimers. They are also used as research reagents as positive controls in assays for identifying antagonists of DP-1/BZP dimerisation and as immunoassay agents.

Also described is the use of sequences antisense to nucleic acids cencoding (I)-(III) becauted by levels in cells, particularly by control of the property of the prevent or prevent care or preventiated with cytotoxic or cytostatic agents,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DP-1; transcription factor; antagonist; E2F protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour; surgical stent; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Similarity 100.0%; Score 42; DB 19; Length 19; Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                         Peptide H2mt2 is based on peptide H2 (see AAW30504) from the DEF box
                                                                                                                                                                                                                                                                                                                                                                                                                    (see AAW30501) of transcription factor DP1. In HZmt2, amino acid aresidues of HZ that correspond to DP1 residues Arg167 and Asp171 are substituted by Ala residues. HZ is an antagonist of the heterodimerisation of DP1 with EZF. HZmt2 retains some, but not heterodimerisation of activity. HZ and other claimed peptides (see AAW30504-07) from the DEF box region of DP1 can be used to induce apoptosis, specifically in tumour and cardiovascular cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   transcription factor; antagonist; E2F protein; apoptosis; proliferation; cardiovascular cell; restenosis; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                        Peptide H3 comprises amino acid residues 174-193 in the DEF box (C [1] (see AAW30501) of transcription factor DP1. Claimed peptides (C [1]) (see AAW30504-07) containing one or both of 2 motifes (see (II) (see AAW30504-07) containing one or both of 2 motifes (see (II) (see AAW30504-07) containing one or both of 2 motifes (see (II) capture) to the containing the residued are variants of these peptides, especially containing claimed are variants of these peptides, especially containing claimed are variants of these peptides, especially containing containing and 175 of DP-1, fusion proteins (II) comprising (I) of (II) and a containing containing (I) of (III) are used to cardiovascular cells, either in vivo or in vitro, e.g. for purging cardiovascular cells, either in vivo or in vitro, e.g. for purging creat or prevent restenosis in patients who have undergone treat or prevent restenosis in patients who have undergone antioplasty. (I)-(III) function by inactivating the DNA-binding angioplasty. (I)-(III) function in assays for identifying cardiovascular is a positive controls in assays for identifying antagonists of DP-1/E2F dimerisation and as immunosasky agents.

Also described is the use of sequences antisense to nucleic acids encoding (I)-(III) to control DP levels in cells, particularly by control of the particularly by control of the prevent capture of the particularly by control of the control of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              E2F activity inhibitors - for treatment and prevention of tumours

```

```
This represents a compound that can inhibit E2F activity. The compound is of the formula R1 - A - R2 where R1 is an optionally substituted alkanoyl, alloyl, hetero-arylcarbonyl, alkoxycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family dimer forming region or DNA binding region, of at least 12 consecutive amino acide. Compounds of this formula can be used to inhibit E2F activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                 This represents a compound that can inhibit E2F activity. The compound also of the formula R1 - A - R2 where R1 is an optionally substituted alkanoyl, alloyl, hetero-arylcarbonyl, alkoxycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy hetero, and A1 is an B2F family dimer forming region or DNA binding region, of at least 12 consecutive amino acids. Compounds of this formula can be used to inhibit E2F activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Claimed peptides (II) (see AAW30504-07) containing one or both of 2 motifs (see AAW30504-07) containing one or both of 2 motifs (see AAW30502-03) of the DEF box are capable of antagonising the heterodimerisation of a DP protein with an E2F protein. Also claimed are variants of these peptides, especially containing and 175 of DP-1, fusion proteins (III) comprising (I) or (II) and 175 of DP-1, fusion proteins (III) comprising (I) or (II) and membrane translocation sequence (see AAW30508), expression vectors cencoding (I)-(III) and host cells. (I)-(III) are used therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging bone marrow. Surgical stents comprising (I)-(III) are used to
                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    treat or prevent restenosis in patients who have undergone angioplasty. (I)-(III) function by inactivating the DNA-binding activity of DP/R2F heterodimers. They are also used as research reagents, as positive controls in assays for identifying antagonists of DP-1/R2F dimerisation and as immunoassay agents. Also described is the use of sequences antisense to nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DP-1; transcription factor; antagonist; E2F protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour; surgical stent; therapy.

Claimed fragments (II) (see AAW3052-07) of (I) are capable of antagonising the heterodimerisation of a DP protein with an ESF protein. Also claimed are fusion proteins (III) comprising (I) or (II) and a membrane translocation sequence (see AAW30508), expression vectors encoding (I) (III) and host cells. (I)-(III) are used therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging bone marrow. Surgical stents comprising vitro, e.g. for purging bone marrow. Surgical stents comprising the DNA-binding activity of DP/E2F heterodimers. They are also
                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide H2mtl is based on peptide H2 (see AAW30504) from the DEF box (see AAW30501) of transcription factor DP1. The H2mtl peptide, in which H2 residues corresponding to DP1 residues Val169 and Val175 are substituted by Ala residues, behaves in a similar fashion to the wild-type H2 peptide in its ability to inactivate E2F site DNA binding activity in D9 EC call extracts. H2 is an antagonist of the heterodimerisation of DP1 with E2F. Thus, the Val-169 and Val-175 residues of H2 play little role in this activity. H2 and other claimed peptides (see AAW30504-07) from the DEF box region of DP1 can be used to induce apoptosis, specifically in tumour and cardiovascular cells, e.g. for the prevention of restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DP-1; transcription factor; antagonist; E2P protein; apoptosis; cell proliferation; cardiovascular cell; restenosis; tumour; surgical stent; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                              AAW30515;
                                                                                                                                                                                                                                                                                                    SOUTH THE PLAN TO SEE THE PLAN
```

```
This sequence represents 42% of the middle region of soybean cell cycle regulatory protein DP-1, as deduced from an isolated cDNA clone (see AAZ34579). The invention relates to nucleic acid fragments (see AAZ34575-83) encoding plant CDC-16, DP-1, DP-2 and E2F cell cycle regulatory proteins (see AAY32159-67). It also relates to the construction of a chimeric gene encoding all or a portion of the cell cycle regulatory protein, in sense or antisense orientation, where expression of the chimeric gene results in producton of altered levels of the cell cycle regulatory protein in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Klein TM, Morakinyo LO, Odell JT, Sakai H;

Peptide H6 comprises amino acid residues 167-180 in the DEF box region (see AAW30501) of transcription factor DP1. Unlike claimed peptides (see AAW30504-07) that contain one or both of 2 motifs (see AAW30502-03) of the DP1 DEF box, peptide H6 is not capable of antagonishing the heterodimerisation of a DP protein with an E2F protein. The claimed peptides, their variants and fusion proteins can be used to induce apoptosis, specifically in tumour and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide HZmt3 is based on peptide H2 (see AAW30504) from the DEF box (see AAW30501) of transcription factor DP1. In H2mt3, amino acid residues of H2 that correspond to DP1 residues Leu173 and Leu176 are substituted by Arg residues. H2 is an antagonist of the heterodimerisation of DP1 with E2F. H2mt3 has none of the antagonistic activity of H2. H2 and other claimed peptides (see AAW30504-07) from the DEF box region of DP1 can be used to induce apoptosis, specifically in tunmour and cardiovascular cells, e.g. for the prevention of restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polypeptide fragments of the DP-1 transcription factor - used for inducing apoptosis, specifically in tumour and cardiovascular cells, e.g. for preventing restenosis
a transformed host cell. The nucleic acids and proteins may be used to facilitate studies of cell cycle regulation in plants, provide genetic tools to enhance cell growth in tissue culture, increase gene transfer efficiency and provide more stable transformations. The proteins may also provide targets to facilitate design and/or identification of cell cycle regulatory proteins that may be useful as herbicides.

The invention relates to a novel cell cycle protein (CCP) and the polymucleotides encoding them. CCP is useful for identifying a compound polymucleotides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the coll cycle or growth of a plant such as Arabidopsis thalians, rice, wheat, cycle or growth of a plant such as Arabidopsis thalians, rice, wheat, cycle or growth of a plant such as Arabidopsis thalians, rice, wheat, cycle or growth of a plant such as Arabidopsis thalians, rice, wheat, cycle or growth of a plant such as Arabidopsis collars, encourage collars, oilseed rape, soybean, sunflower and canola. CC maize, tomato, affalia, oilseed rape, soybean, sunflower and canola. CC maize, tomato, affalia, oilseed rape, soybean, sunflower geneting collars of cc protein or production of CCP protein for modulate the activity aberrant activity. Compounds that bind to or modulate the activity of polympoptide are useful for modifying cell fate, plant development, collars or plant morphology, blochemistry and/or physiology, the length of the Gl, stimulation or enhancement of cell cycle of a plant, initiation, geed set, of GT pand for manched formation, shoot and root initiation and/or development, tuber, fruit, leaf formation, seed set, conditions or resistence to stress copy the polymcleotide conditions, including abiotic stress such as pathogen attack, to modulate e.g. enhance crop yields, conditions and setenuate plant architecture, plant quality traits, plant, conditions and attenuate plant architecture, plant quality traits, plant, conditions and attenuate plant architecture, plant quality traits, plant, ells, processed to an attenuate plant architecture, plant quality traits, plant is parter. CCP is a plant of the plant of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     storage tissues and/or storage organs of plants or its parts. CCP is useful as an immunogen to generate antibodies. CCP protein is useful to screen for naturally occurring CCP substrates. The polymucleotide is useful for expressing CCP protein, to detect CCP mRNA, or a genetic lesion in a CCP gene and to endulate CCP activity. The present sequence represents a motif which may be found in a CCP protein of the invention.
                                                                                                                                                                                                                                                                                                       New cell cycle protein and nucleic acid molecule encoding it useful for regulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 29; DB 23; Length 8;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cell cycle protein; CCP; cell cycle regulation; herbicide; plant growth regulator; plant development; abiotic stress; biotic stress; nutrient deprivation; pathogen attack; crop yield; motif.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrania, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                  Human brain expressed single exon probe encoded protein SEQ ID NO: 30467.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a number of single exon nucleic acid

This sequence represents a Staphylococcus aureus protein, that based on homology with a Lactobacillus plantarum protein, is a pyruvateoxidase (EC 1.2.3.3) mutant (ith P1785, S188M, and A458V mutations) A chain, and is encoded by a DNA sequence of the invention.

The DNA sequences were isolated from Staphylococcus aureus WCHU29 (NCIMB 40771). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the proteins are used for the inhibition of bacterial polypeptides.

Conditions which may be treated include bacterial infections, especially centiarty, cardiac, gastrointestinal, central nervous, eye, kidney, urinary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. pylori infection.
              Staphylococcus aureus protein; immune response induction; eye infection; antibody production; T-cell immune response; gastrointestinal infection; respiratory infection; inhibitor; bacterial infection; central nervous system; kidney infection; urinary tract infection; antimicrobial compound identification; broad spectrum antibiotic;

                                    epidermidis; open reading frame; ORF; bacterial infection; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          epidermidis; open reading frame; ORF; bacterial infection;
                                                                                                                                                                                                                                                                                                                                                                                                       ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35134 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                    Novel isolated nucleic acid encoding a Staphylococcus epidermidis polypeptide, useful for diagnosing and treating bacterial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
             Staphylococcus epidermidis ORF amino acid sequence SEQ ID NO:3697.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Staphylococcus epidermidis ORF amino acid sequence SEQ ID NO:3434.

                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                     ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to compounds able to interfere with the S. epidermidis lifection. N.B. The sequence data for inhibit S. epidermidis infection.
N.B. The sequence data for this patent did not form part of the printed separation, but was obtained in electronic format directly from the sequence.

This represents a compound that can inhibit E2F activity. The compound is of the formula R1 - A - R2 where R1 is an optionally substituted alkanoyl, alloyl, hetero-arylcarbonyl, alkoxycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or anino, and A is an E2F family dimer forming region or DNA binding region, of at least 12 consecutive amino acids. Compounds of this formula can be used to inhibit E2F activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated, enriched, cell free and/or recombinant nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABB67764-68 represent fragments of a wheat E2F-dimerisation partner (DP) protein. The protein acts as a plant E2F transcription factor. E2F and DP are two proteins that hetero-dimerise to form an active transcription factor that regulates G1 to S phase of the cell cycle and later, the expression of genes required for S-phase progression. E2F and retinoblastoma protein also interact as a hetero-dimer in cells to suppress certain genes. This repression involves binding of the retinoblastoma protein to the E2F-DP dimer that is in turn bound to sites on DNA through the E2F DNA binding domain. DP proteins can be modulated to alter plant cell, organ or tissue shape, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
E2F activity inhibitors - for treatment and prevention of tumours and arteriosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           E2F-dimerisation partner; DP protein; E2F transcription factor; G1 phase; S phase; cell cycle; retinoblastoma protein; alter cell proliferation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013310) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, nematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activinhinhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                     Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                              Gaps
particularly to alter cell proliferation characteristic such as to alter plant cell, organ or tissue size.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune disorders -
                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 20; SEQ ID NO 14386; 1399pp + Sequence Listing; English.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention of and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to commend activity of P. acnes polypeptides and activity of P. acnes polypeptides and activity of P. acnes propedies may also be used as clasmostic agents for determining P. acnes presence, by account of immunosorbent assay (ELISA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                              SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to novel nucleic acids encoding novel human foetal antigens. The nucleic acids and proteins are used to prevent, treat (e.g. by gene therapy) or ameliotzate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition. The antibodies to the antigens can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunoassays (BLISA). Disorders which are diagnosed or treated immunoassays (BLISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, viruses and fungi and ocular disorders e.g. cardiac arrest, by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be accepted all wound healing and epithelial ecll proliferation, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         prevent skin aging due to sunburn, to maintain organs before transplantarion, for supporting cell culture of primary issues, to regenerate tissues and in chemotaxis. The polypeptides can also be use a food additive or preservative to increase or decrease storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. Numerous examples of diseases and disorders treated by the nucleic acids and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 proteins are given in the specification. The present sequence

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and cancer antigens. The colon cancer antigens have cytostatic activity and cancer antigens. The colon cancer antigens are collectively may be used in gene therapy and vaccine production. N and P may be used in the prevention, caypression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing in a patient's genome that affect the activity of P by expressing in a patient's genome that affect the activity of P by expressing to expressing the nucleic acids into a host cell and culturing the cell color cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell concertal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX in the specification). ABN15762 to ABN27252 encode the human ORFX creating given in ABB0010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a graduence can be used in the manufacture of a medicament for treating a sequence can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, treatment of cancer, hyperproliferative disorders, introbes of liver, transplantation, cardiovascular diseases, disbetes mellitus, systemic clupus errythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious disease autoimmune inflammentory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, correction or regenerative disorders, or periodomtal disease, and for gut correction or regenerative disorders, or periodomtal disease, and for gut correction or regeneration and treatment of lung or liver fibrosis, men who servence das experience or sequence or have a maintiple scleroid gut second correction or regeneration and treatment of lung or liver fibrosis, mented and experience or systemic cytchine damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are solutions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergias, autoimmune hamolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections.

(Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia;
                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27525 encode the human ORFX in the specification). ABN15762 to ABN27525 encode the human ORFX coproteins given in ABB0010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a squence can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, treatment of cancer, hyperproliferative disorders, introsis of liver, consolvantials, benign tumours, keloid, degenerative disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, disorders infectious consensative disorders such as multiple sclerosis, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid disease and autoimmune inflammators of organization gravis, graft-versus-host consensative disorders incisions, ulcers, for treating osteoporosis, or periodomical disease, and for gut correction or regeneration and treatment of lung or liver fibrosis, repertusion injury in various tissues and conditions resulting from the manager.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human polynucleotides (AA179941-AA193841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or which may induce production of other cytokines in other cell populations. The polympetides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, mematopoissis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and activity and activity and activity and activity activity and activity and activity and activity of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; dyperprofiferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis; myasthenia gravis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 73 ORPs are shown. The proteins are variously cell envelope proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of fellocobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated human polynucleotides containing single nucleotide polymorphisms, useful for the treatment and diagnosis of e.g. cancer, infection and diabetes -
                                                                                                                                                                                    Helicobacter pylori nucleic acids and proteins - used to develop products for the detection, prevention and treatment of H. pylori
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, single nucleotide polymorphism, SNP, paternity test,
forensic test, aberrant protein expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a H. pylori cytoplasmic protein.

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors.

The genomic sequence of H. pylori (ATCC 55679) was determined from everlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORP of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                      The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous soclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolaemia, obesity or autoimmunity. The present sequence is a peptide encoded by a polymorphism-containing oligonucleotide fragment of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide #12567 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                       Gaps

As series of synthesised peptides (AAR63492-9) based on the amino acid sequence of the novel rat serotonin receptor REC20. The peptides were used either in the generation of antibodies for the diagnosis of the cued either in the generation of antibodies for the diagnosis of the receptors in the detection of materials binding to the receptors.

Serotonin receptors belong to at least two protein superfamilies:
Serotonin receptors containing 7 TMDs (including of FPM2) and ligand-gated ion channel receptors with 4 protectives that fall into three new serotonin subfamily classifications:
TMDs (5-HT13). The serotonin receptors presented in the pattent represent protectypes that fall into three new serotonin subfamily classifications:
TMDs (6-HT3). The serotonin receptors presented in the pattent represent claudivided into 5-HT5alpha, rat REC17 - AAQ72259 and 5-HT5a

Sequences found in the TMDs. Degenerate primers were conserved amino acid sequences found in the TMDs. Degenerate primers were constructed to sequences and used in two rounds of nested PCR amplification of a mplification, degenerate primers corresponding to conserved residues camplification, degenerate primers corresponding to conserved residues those receptors. The resultant fragments were cloned into pBluescript those receptors.

       cDNA library to obtain full length clones. The nucleic acids molecules and their corresponding proteins may be used in methods for determining ligand binding activity, detecting and altering expression of serotonin receptors, drug screening and therapeutic treatments involving human serotonin receptors. Serotonin receptors are also known to participate in neurological processes. Pathologies including dementia, Parkinson's disease, eating disorders, pathological anxiety, migraine, headaches, insommia and other conditions.

(Updated on 25-MAR-2003 to correct PN field.)
 The plasmid fragments were used to screen a rat hypothalamus
                                                                                                                                                                Gaps

AAZ65250 to AAZ65150 represent 97 isolated human secreted protein genes.

AAY76124 to AAY76223 are the secreted proteins encoded by the 97 human genes. This sequence represents a fragment of one of the human secreted proteins. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 97 genes, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foctal deficiencies, blood disorders, diseases of the immune system, autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive disorders, achizophrenia, arthritis, asthma, psoriasis, sepsis, skin disorders, diseases, inflammation, allergies, Alzheimer's and cognitive disorders, diseases, infections and AIDS. The polypeptides are also useful for identifying their binding partners.

The sequences shown in AAY76224 to AAY76424 represent fragments of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, liver, cirrhosis; hyperlipoproteinaemia; hyperlipidaemia; hypercholesterolaemia; coronary heart disease.

     The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver. Comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG59930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human peptide #482 encoded by breast cell single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label
                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes -

bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysts is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human feetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                       Protein #474 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single exon nucleic acid probes for analyzing gene expression in human hearts -

They can be used to measure gene expression in brain cell samples, which may enable diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                           Human brain expressed single exon probe encoded protein SEQ ID NO: 25905.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Single exon nucleic acid probes for analyzing gene expression in human brains - \,

                                                                                                                                                                                                                                                                                                              The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide #491 encoded by probe for measuring cervical gene expression.

```
The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to novel single exon nucleic acid probes (see AA100010-AA110067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development,
                                                                                                                                                                                                                                                                                                                                                           encoded by probe for measuring human breast gene expression.
                                                                                                                                                                                                                                                                                                                                                                                          inflammatory disease; proliferative breast disease; non-carcinoma tumour.
                                                                                     encoded by one
                                                                      The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of

Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung, measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with
inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human peptide encoded by genome-derived single exon probe SEQ ID 25501.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Spatially-addressable set of single exon nucleic acid probes, used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histicoyrosis; lymphangiolelenomyoncosis; Karagener syndrome; pulmonary alveolar proteinnosis; fibrocyetic pulmonary dysplasia; primary ciliary dyskinesis; pulmonary hypertension;

```
mRNA, and (b) measuring the label detectably bound to each probe of mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising

(a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting at seat one exon from genomic sequences of the eukaryote; and (b) detecting appecific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of acroarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes of 12011 sequences, mentioned in the specification, or encoded by the probes are used for gene of 12011 sequences, mentioned in the specification, or encoded by the probes are used for gene of 12011 sequences, mentioned in the study of lung diseases using human lung derived mRNA and for the study of lung diseases (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, hermonally and proverse (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary content disease, Hermann-Pick disease, Hermannsky-Pudlas syndrome, saccidesis, pulmonary becames at the exons the exons in the probes of Hermannsky-Pudlas syndrome, saccidesis, pulmonary becames and the probes of Hermannsky-Pudlas syndrome, saccidesis, pulmonary and proventing and p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunomodulatory; cytostatic; neuroprotective; vulnerary; nootropic; anticonvulsant; antiarthritic; cerebroprotective; antifungal; antiaviral; antibacterial; antialierglic; dermatological; haemostatic; antiasthmatic; thrombolytic; immunogen; antibody; gene therapy; neurological disorder; parkinson's disease; inflammatory disorder; cancer; asthma; osteoporosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           haemosiderosis, pulmonary histiocytosis, lymphangioleiomyontosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
collection of detectably labeled nucleic acids derived from human lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           novel protein; Antianaemic; osteopathic; antiinflammatory;

The invention relates to polymucleotides encoding novel human correcting or their active domains. The polymeptides, polymucleotides and antibodies raised against the polymeptides are used in a method of contraction of antibodies caused by the aberrant correction activity. The polymeptides caused by the aberrant corresponds which bind to the protein expression or activity. The polymeptides can be used as complements, and in antibody production. The polymeptides are used to identify compounds which bind to the polymeptides. Polymucleotides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the polymeptides of the invention are used as probes and primers, for sequencing, for chromosome or gene mapping, in the corresponds of the invention can be used to target drugs to a tumour, in assays to determine biological activity, to target drugs to a tumour, in assays to determine biological activity, to target drugs to a tumour, in assays to determine biological activity, to cases antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Copypeptides of the invention may also be useful in treating platelet copypeptides of the invention may also be useful in treating platelet contraceptive, treating observations, and diseases, amylotrophic lateral ing antibodies and osteoarthritis, anaemia, allered information or from autoinmunity, cancer, allered, anaemia, contraceptive, treating one copyment of stems and huntington's allsease, amylotrophic lateral contraceptive, immune deficiencies resulting from bacterial, viral or copyment in a fine and any anaemia, allered and all
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                   Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disorders, and infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         anti-inflammatory diseases, nervous system disorders, and i
The present sequence represents a protein of the invention.

Sequence 2, Application US/09900147

Patent No. US20020103121A1

GENERAL INFORMATION:

APPLICANT: La Thangue, Nicholas B

APPLICANT: Bandara, Lasantha R

TITLE OF INVENTION: Peptide antagonists of DP transcription factors

TITLE OF INVENTION: Peptide antagonists of DP transcription factors

TITLE OF INVENTION: Peptide antagonists of DP transcription factors

CURRENT APPLICATION NUMBER: US/09/900,147

CURRENT FILING DATE: 2001-07-09

PRIOR APPLICATION NUMBER: EARLIER APPLICATION NUMBER: 09/308,935

PRIOR PELING DATE: EARLIER FILING DATE: 1996-12-20

NUMBER OF SEQ ID NOS: 18

SOFTWARE: Patentin Ver. 2.1

LENGTH: 9

TYPE: PR

CORANIES: Artificial Sequence

FEATURE:

OTHER INFORMATION: Description of Artificial Sequence: Synthetic

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
